

Labor Market Dynamics and Regional Fertility: A Spatial Analysis for Germany

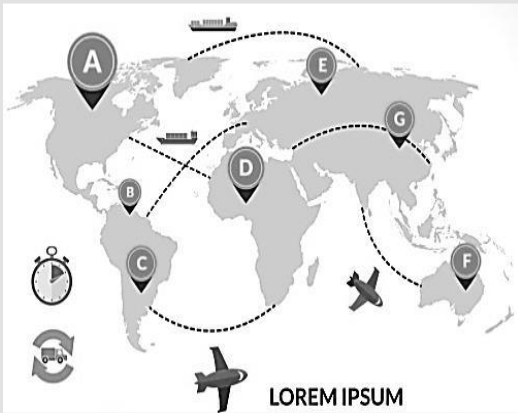

RC28 Summer Meeting

*Chen Luo
Interdisciplinary Centre for Labour Market and Family Dynamics (LABFAM),
University of Warsaw*

Jobs & Children

- Unemployment (Adsera, 2004; Becker, 1961; Oppenheimer, 1994)
 - The relationships are gendered
- Uncertainty (Vignoli, D., *et al*, 2020)
 - Objective uncertainty vs subjective uncertainty
- Labor market dynamics
 - The drivers of employment fluctuation

Labor Market Dynamics

The *creation* and *destruction* of job opportunities

Labor Market Dynamics

- Job Creation: gauges the ease with which an individual can secure his/her current job or transition to another one.
 - It's calculated by aggregating job gains from expanding industries within a specific region.
- Job Destruction measures the likelihood of an individual losing their current job.
 - It's calculated by aggregating job losses from contracting industries within a specific region.

Research Questions and Hypotheses

- How do labor market dynamics affect regional fertility?
 - Job Creation
 - + Lower risks of job loss
 - + Career development opportunities
 - Potential life adjustments
 - Work-life conflicts
 - Job Destruction
 - Objective job instability
 - Subjective job insecurity
 - + Secure personal life through childbearing

Research Questions and Hypotheses

➤ Do the effects vary by gender?

- ❖ The “modern” male breadwinner model in Germany
- ❖ Are men more affected by job loss?
- ❖ Gendered concentration in occupations and industries

- ❖ More women in the labor market, but still disadvantaged
- ❖ More social benefits for employed women
- ❖ Job loss as an opportunity for childbearing

Data and Methodologies

- Employment data from 2008 to 2019 by industries (WZ2008~88 industries) are from the Federal Employment Agency of Germany
 - Only for workers who are subject to social security contribution
- Data on the rest of the variables were derived from the Regional Database Germany

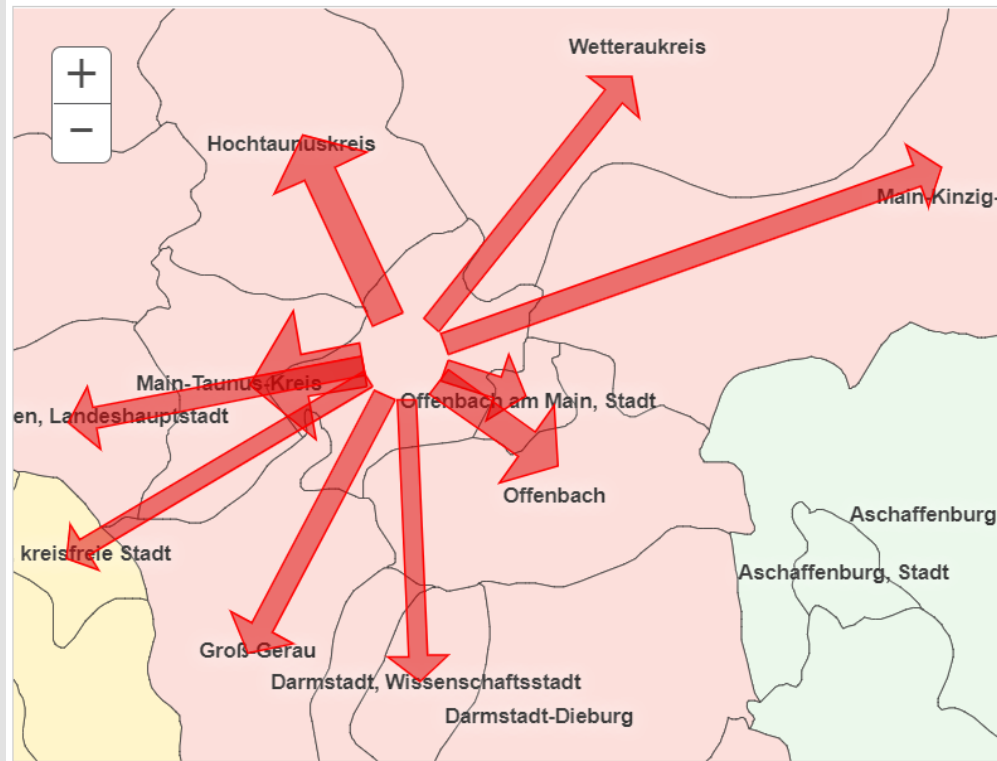

Data and Methodologies

- Labor market dynamics are measured for all workers, female workers solely, and male workers solely
- Spatial panel data modeling to identify the patterns of changes over time and space
 - Spatial Durbin Model to account for
 - ✓ Diffusion of TFR
 - ✓ Labor mobility and spillover of labor market changes

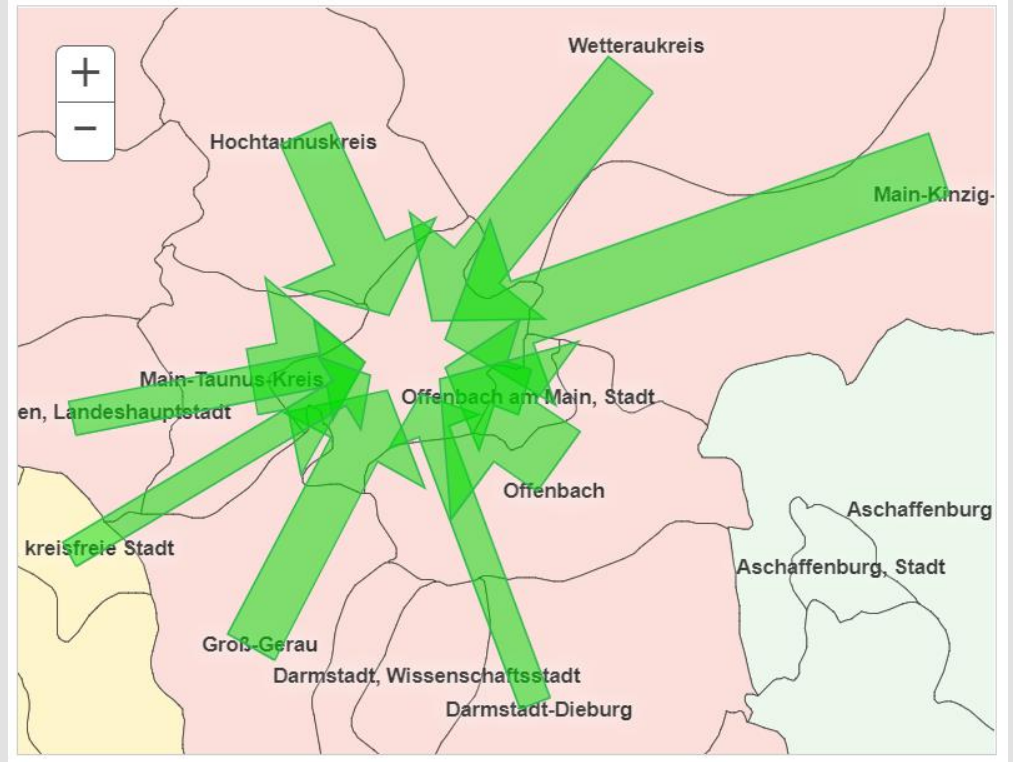

$$y_{it} = \delta \sum_{j=1}^N w_{ij} y_{jt} + x_{it} \beta + \sum_{j=1}^N w_{ij} x_{ijt} \gamma + \mu_i + \varepsilon_{it}$$

Regional Total Fertility Rate in Germany

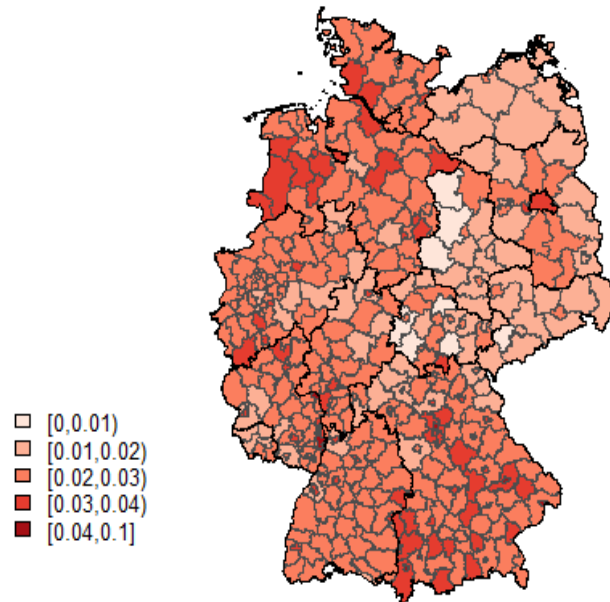

Regional TFR in Germany, 2010 and 2020

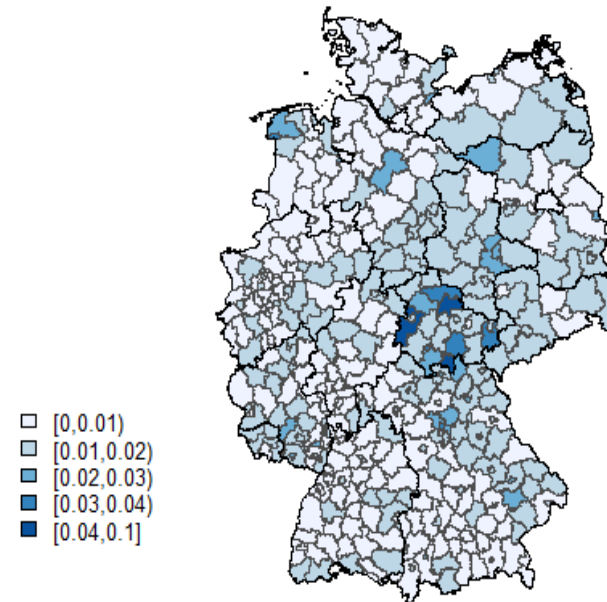

Descriptive Results

Labor Market Dynamics for All Workers

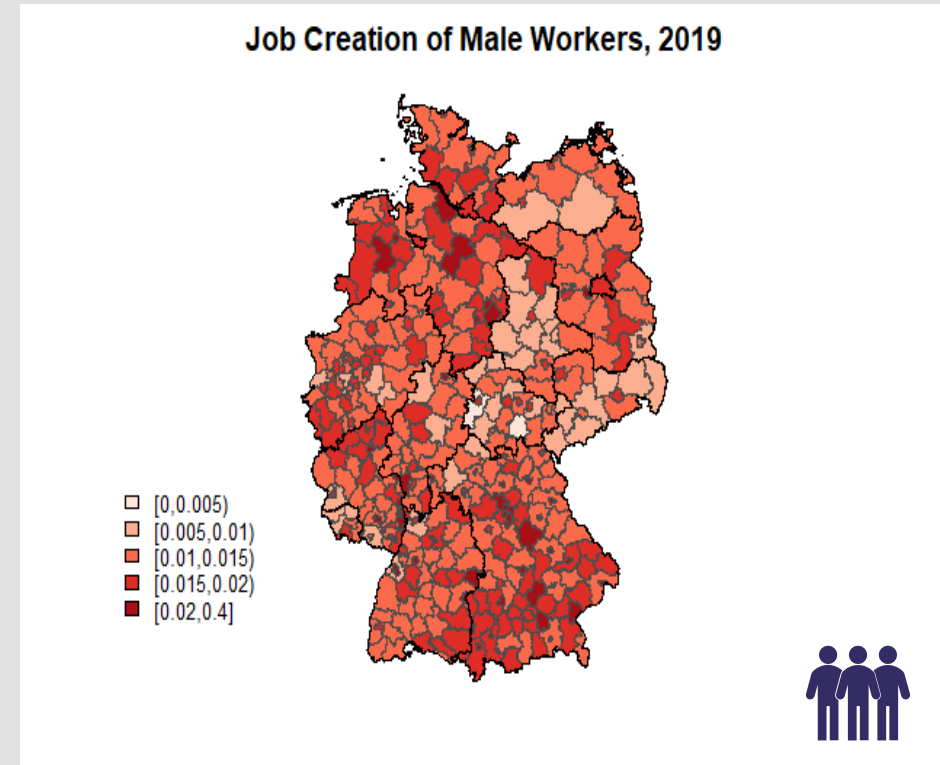

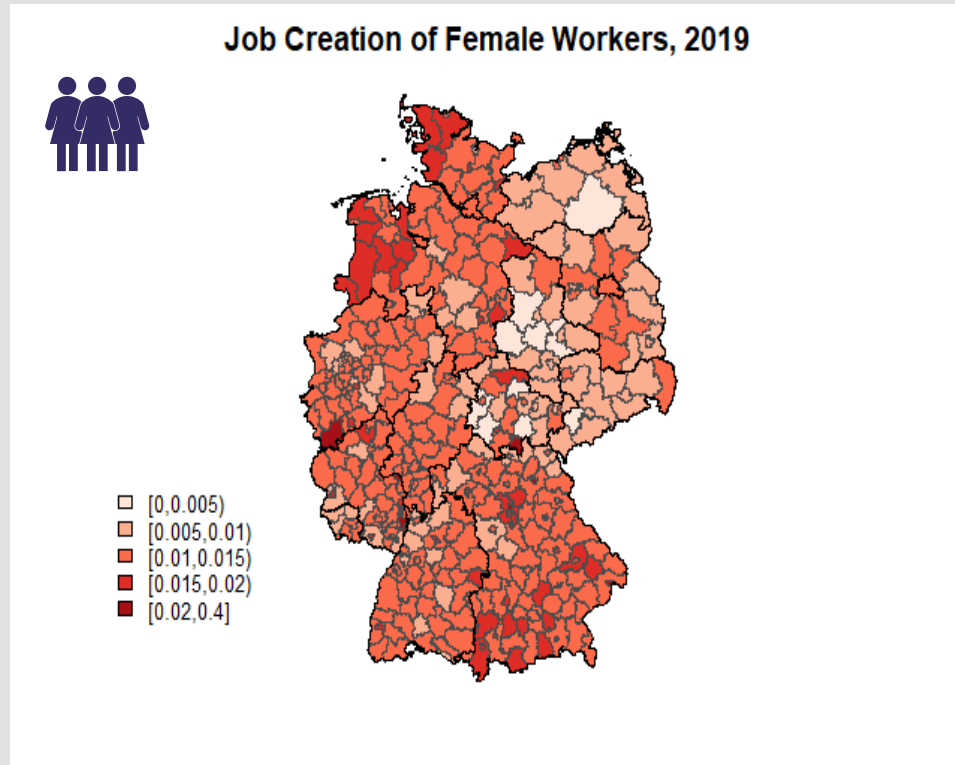

Job Creation of All Workers, 2019

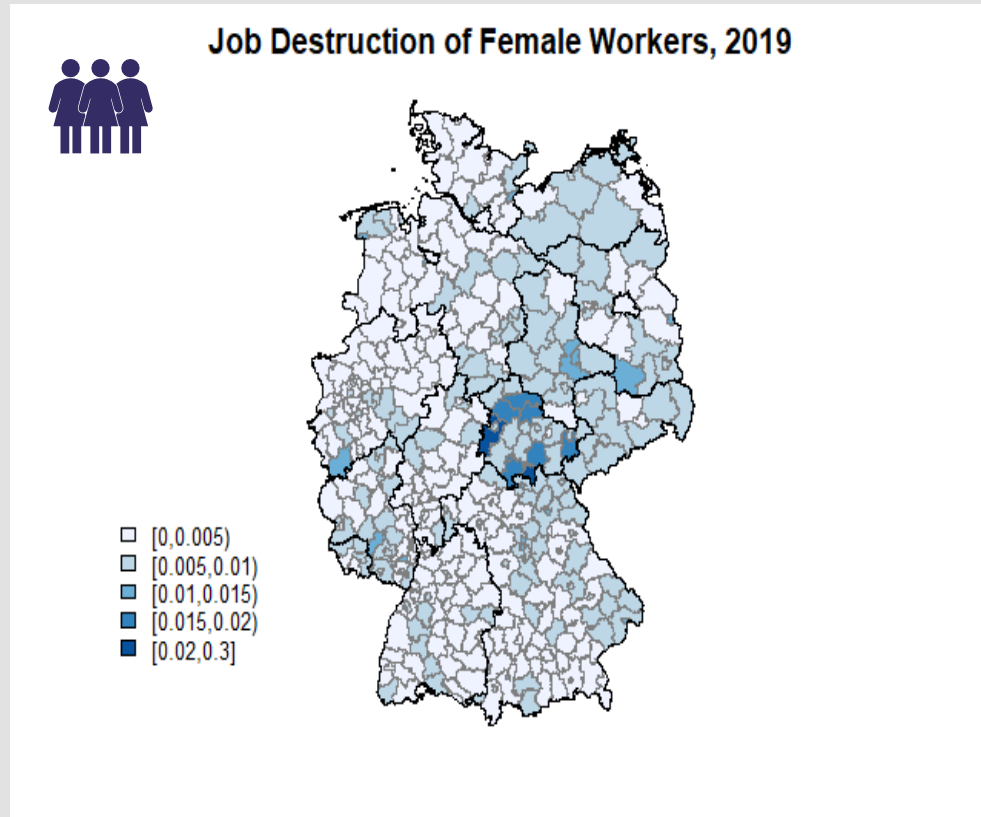

Job Destruction of All Workers, 2019

Descriptive Results: Gender-Specific Job Creation

Descriptive Results: Gender-Specific Job Destruction

Result 1: Labor Market Dynamics for All Workers

Dependent Variable: TFR	1	2	3
Job Creation	0.410*	0.335†	0.530**
Job Destruction	-0.514**	-0.502**	-0.585**
Job Creation (Spatial Lag)	-1.174***		-1.065***
Job Destruction (Spatial Lag)	0.347		-0.308
Year of Economic Crisis			-0.018***
Spatial Lag of TFR	0.094***		0.485***

Control variables:

Female labor force participation (20-30)
Log GDP per capita,
Housing Price,
Share of Expats at fertility ages

Additional variables for the robustness test:
The proportion of women between 20-45

Notes: Source: author's calculation based on data from the Federal Employment Agency of Germany and the Regional Database Germany.

Abbreviation: GDP: gross domestic product.

Significance levels: † <10% * <5% ** <1% *** <0.1%

Results 2: Gender-Specific Labor Market Dynamics

Dependent Variable: TFR	Models for Female Workers		Models for Male Workers	
	4	5	6	7
Job Creation of Female/Male Workers	0.954**	1.056**	0.466+	0.401
Job Destruction of Female/Male Workers	-0.613	-1.131**	-0.870***	-0.751**
Female/Male Workers	-2.009**	-2.203***	-1.757***	-1.842***
Female/Male Workers (Spatial Lag)	0.629	0.985	0.487	0.635
Gender Employment Gap		-1.404***		-1.368***
Gender Employment Gap (Spatial lag)		0.506*		0.467*
Spatial Lag of TFR	0.095***	0.093***	0.092***	0.091***

Control variables:

Female labor force participation (20-30)
Log GDP per capita,
Housing Price,
Share of Expats at fertility ages

Additional variables for the robustness test:

The proportion of women between 20-45

Notes: Source: author's calculation based on data from the Federal Employment Agency of Germany and the Regional Database Germany.

Abbreviation: GDP: gross domestic product.

Significance levels: † <10% * <5% ** <1% *** <0.1%

Direct Effect and Indirect Effect

$$y_{it} = \delta \sum_{j=1}^N w_{ij} y_{jt} + x_{it} \beta + \sum_{j=1}^N w_{ij} x_{ijt} \gamma + \mu_i + \varepsilon_{it}$$

Independent Variable:

Dependent Variable:

Job creation at region i

TFR of region i

Job creation of region i 's neighboring regions

TFR of region i 's neighboring regions

Direct effect

Indirect effect

Results 3 :

Direct and Spillover Effects

Model	Labor Market Dynamics	Average Direct Effects	Average Indirect Effects	Average Total Effect
All Workers	Job Creation	0.3897	-0.0031	0.3866
	Job Destruction	-0.5090	0.0008	-0.5082
Female Workers	Job Creation	0.9187	-0.0052	0.9135
	Job Destruction	-0.6029	0.0015	-0.6014
Male Workers	Job Creation	0.4353	-0.0046	0.4306
	Job Destruction	-0.8630	0.0011	-0.8619

Conclusion

- Overall, job creation has a positive effect on the regional total fertility rate, whereas job destruction has the opposite effect
- For female workers, the effect of job creation is more pronounced and stronger than that of job destruction;
- For male workers, job destruction plays a more essential role in fertility than job creation
- Controlling for the gender employment gap makes the effects of labor market dynamics stronger for women and weaker for men
